Alternative 5 was selected from the possible options for the project and is described in detail in the Environmental Impact Statement. Here is a treatment map for Alternative 5, showing the location of Unit 623417.

A closer look at Unit 623417 shows that the interior of the unit would be treated mechanically to cut brush (including conifer saplings) and mechanical piling. The outside strip of the unit was designed as a 300 foot buffer that would be commercially thinned and masticated.
The commercial operations for Unit 623417 are now complete around the 300 foot buffer on the edge of the unit. The second part of the treatment, post logging mastication, is also complete in part of the buffer strip.
